2025/10/29 14:01 1/3 GitLab User Documentation

GitLab User Documentation

Welcome on the UNIGE GitLab documentation. You will find here all the information you need to use the UNIGE GitLab instance.

See:

- https://gitlab.unige.ch/help/user/index.md if you are looking for the upstream documentation of the UNIGE GitLab running instance.
- 2. https://catalogue-si.unige.ch if you need to contact the team behind GitLab.

Learning

Please see the UNIGE official formations at https://spc.unige.ch/en/teaching/digitalskills/ (old https://spc.unige.ch/en/teaching/digitalskills/).

Access

gitlab.unige.ch is open to the whole Swiss educational audience via SWITCHaai (UNIGE members should use their ISIs credentials) and to any non-academic entity via SWITCH edu-ID (free registration required). For this reason, password authentication has been deactivated.

SSH

Git clone/push/pull are available:

- 1. via SSH (see https://gitlab.unige.ch/help/user/ssh) after either the user has added a key in the GitLab profile settings or one of the project administrators has set up a **Deploy Key** in the GitLab project interface (see https://gitlab.unige.ch/help/user/project/deploy keys/index.md)
- via HTTPS after the user has generated a **Personal Access Token** in the GitLab profile settings (see https://gitlab.unige.ch/help/user/profile/personal_access_tokens.md) or one of the project administrators has set up a **Deploy Token** in the GitLab project interface (see https://gitlab.unige.ch/help/user/project/deploy_tokens/index.md)

Permissions

Access to each resource is directly managed **per (sub)group or project** via the web interface (see https://gitlab.unige.ch/help/user/permissions).

To easy access management, you should think in a hierarchical terms from the very beginning:

1. create a top-level group with the least possible members (basically, only the administrators)

Last update: 2025/06/11 12:27

2. inside this group, create sub-groups or projects with specific permissions

Independently of the authentication source (SWITCHaai or SWITCH edu-ID), those users without a UNIGE mail address will automatically get an **external** account (see https://gitlab.unige.ch/help/user/permissions#external-users), which means that:

- 1. they can not create groups or projects
- 2. read access to private or internal projects must be explicitly granted
- 3. read access to public projects is permitted
- 4. write access to any project must be explicitly granted

Resources

By default, the following settings apply to any internal users:

- 1. maximum number of projects: 20
- 2. maximum size of a single project: 100MB
- 3. maximum size of an attachment: 10MB
- 4. maximum size of a single git push: 1MB

Please contact the UNIGE GitLab administrators (see https://catalogue-si.unige.ch/gitlab) if you need more resources.

If you need to store **large** files such as audio, video or graphics ones, please consider switching to Git LFS!

Features

The UNIGE GitLab instance is based on the upstream **Community Edition** (cf. https://about.gitlab.com/install/ce-or-ee/), since until now no Enterprise features have been needed after various evaluation.

Of the CE-included feature, the UNIGE GitLab instance does not support the following ones:

- 1. CI/CD shared runners (cf. https://dataforum.unige.ch/t/gitlab-runners-not-available/401)
- 2. Pages (cf. https://dataforum.unige.ch/t/gitlab-pages-support/194)
- 3. PlantUML (cf. https://gitlab.unige.ch/help/administration/integration/plantuml.md via https://support-si.unige.ch/openentry.html?tid=INC000000146442)

Project visibility

By default, each project is **private**, *i.e.* they can only be cloned and viewed by project members.

For more details, please check the corresponding section of the upstream documentation of the

2025/10/29 14:01 3/3 GitLab User Documentation

UNIGE GitLab instance.
