Utilization and accounting

When you submit jobs, they are using physical resources such as CPUs, Memory, Network, GPUs, Energy etc. We keep track of the usage of some of those resources. On this page we'll let you know how to consult your usage of the resource. We have several tools that you can use to consult your utilization: sacct, sreport, openxdmod

Comparison of sreport, sacct, and sshare

We use **sreport** as our primary accounting reference. However, you may find other tools useful for specific purposes. Here's a comparison:

- **sacct**: Displays only account jobs, excluding time allocated via reservations. If duplicate jobs exist, only one is shown.
- **sreport**: By default, jobs with wall times overlapping the report's time range are truncated. For reservation-based jobs, the requested idle time is distributed among all users with access to the reservation.
- **sshare**: Not recommended for accounting purposes; displayed values are adjusted based on fairshare calculations.

Resource accounting uniformization

We charge usage uniformly by converting GPU hours and memory usage into CPU hour equivalents, leveraging the [TRESBillingWeights](#) functionality provided by SLURM.

A CPU hour represents one hour of processing time by a single CPU core.

For GPUs, SLURM assigns a conversion factor to each GPU model through TRESBillingWeights (see below the conversion table), reflecting its computational performance relative to a CPU. Similarly, memory usage is also converted into CPU hour equivalents based on predefined weights, ensuring

that jobs consuming significant memory resources are accounted for fairly.

For example, a job using a GPU with a weight of 10 for 2 hours and memory equivalent to 5 CPU hours would be billed as 25 CPU hours. This approach ensures consistent, transparent, and fair resource accounting across all heterogeneous components of the cluster.

You can see the detail of the conversion by looking at the parameter of a random partition on any of the clusters. We are using the same conversion table everywhere.

```
(bamboo)-[root@slurm1 ~]$ scontrol show partition debug-cpu | grep
TRESBillingWeights | tr "," "\n"
  TRESBillingWeights=CPU=1.0
Mem=0.25G
GRES/gpu=1
GRES/gpu:nvidia_a100-pcie-40gb=5
GRES/gpu:nvidia_a100_80gb_pcie=8
GRES/gpu:nvidia_geforce_rtx_2080_ti=2
GRES/gpu:nvidia_geforce_rtx_3080=3
GRES/gpu:nvidia_geforce_rtx_3090=5
GRES/gpu:nvidia_geforce_rtx_4090=8
GRES/gpu:nvidia_rtx_a5000=5
GRES/gpu:nvidia_rtx_a5500=5
GRES/gpu:nvidia_rtx_a6000=8
GRES/gpu:nvidia_titan_x=1
GRES/gpu:tesla_p100-pcie-12gb=1
```

Here you can see for example that using a gpu nvidia_a100-pcie-40gb for 1 hour is equivalent in term of cost to use 5 CPUhour.

Resources available for research group

Research groups that have invested in the HPC cluster by purchasing private CPU or GPU nodes benefit from high priority access to these resources.

While these nodes remain available to all users, owners receive priority scheduling and a designated number of included compute hours per year.

To check the details of their owned resources, users can run the script `ug_getNodeCharacteristicsSummary.py`, which provides a summary of the node characteristics within the cluster.

Example:

```
ug_getNodeCharacteristicsSummary.py --partitions private-<group>-gpu
private-<group>-cpu --cluster <cluster> --summary
host      sn          cpu      mem      gpunumber      gpudeleted      gpumodel
gpumemory  purchasedate      months      remaining      in prod. (Jan 2025)      billing
-----  -----  -----  -----  -----  -----  -----  -----  -----  -----  -----
```

<hr/>							
===== Summary =====							
<hr/>							
Total CPUs: 1364 Total CPUs memory[GB]: 6059 Total GPUs: 61 Total GPUs memory[MB]: 142300 Billing: 1959 CPUhours per year: 10.30M							

How to read the output:

- **host**: the hostname of the compute node
- **sn**: the serial number of the node
- **cpu**: the number of CPUs available in the node
- **mem**: the quantity of memory on the node in GB
- **gpunumber**: the number of GPU cards on the node
- **gpudeleted**: the number of GPU cards out of order
- **gpumodel**: the GPU model
- **gpumemory**: the GPU memory in MB per GPU card
- **purchasedate**: the purchase date of the node
- **months remaining in prod. (Jan 2025)**: the number of months the node remains the property of the research group, the reference date is indicated in parenthesis. In this example it is January 2025.
- **billing**: the [billing](#) value of the compute node

You can modify the reference year if you want to “simulate” the hardware you'll have in your private partition in a given year. To do so, use the argument `--reference-year` of the script.

Job accounting

OpenXDMoD

We track the job usage of our clusters here: <https://openxdmod.hpc.unige.ch/>

We have a tutorial explaining some of the features: [here](#)

Openxdmod is integrated into our SI. When you connect to it, you'll get the profile “user” and the data are filtered by your user by default. If you are a PI, you can ask us to change your profile to be PI.

OpenXDMoD currently supports only CPUh and GPUh metrics, not the [billing](#) metrics (yet?). For this reason, you need to use [sreport or our script](#) if you want to view the billed metrics.

sacct

You can see your job history using `sacct`:

JobID	JobName	Partition	Account	AllocCPUS	State	ExitCode
45517641	jobname	debug-cpu	rossigno	1	FAILED	2:0
45517641.ba+	batch		rossigno	1	FAILED	2:0
45517641.ex+	extern		rossigno	1	COMPLETED	0:0
45517641.0	R		rossigno	1	FAILED	2:0
45518119	jobname	debug-cpu	rossigno	1	COMPLETED	0:0
45518119.ba+	batch		rossigno	1	COMPLETED	0:0
45518119.ex+	extern		rossigno	1	COMPLETED	0:0

Report and statistics with sreport

To get reporting about your past jobs, you can use `sreport` (<https://slurm.schedmd.com/sreport.html>).

We wrote a helper that you can use to get your past resource usage on the cluster. This script can display the resource utilization

- for each user of a given account (PI)
- total usage of a given account (PI)

```
(baobab)-[sagon@login1 ~]$ ug_slurm_usage_per_user.py -h
usage: ug_slurm_usage_per_user.py [-h] [--user USER] [--start START] [--end
END] [--pi PI] [--group GROUP] [--cluster {baobab,yggdrasil,bamboo}] [--all_
users] [--report_type {user,account}] [--time_format
{Hours,Minutes,Seconds}]
                                         [--verbose]
```

Retrieve HPC utilization statistics for a user or group of users.

options:

-h, --help	show this help message and exit
--user USER	Username to retrieve usage for.
--start START	Start date (default: first of month).
--end END	End date (default: now).
--pi PI	Specify a PI manually.
--group GROUP	Specify a group name to get all PIs belonging to it.
--cluster {baobab,yggdrasil,bamboo}	Cluster name (default: all clusters).
--all_users	Include all users under the PI account.
--report_type {user,account}	Type of report: user (default) or account.
--time_format {Hours,Minutes,Seconds}	Time format: Hours (default), Minutes, or Seconds.

--verbose

Verbose output.

By default when you run this script, it will print your past usage of the current month, for all the accounts you are member of.

Usage example to see the resource usage from the beginning of 2025 for all the PIs and associate users of the group private_xxx. The group private_xxx owns several compute nodes:

```
(baobab)-[sagon@login1 ~]$ ug_slurm_usage_per_user.py --group private_xxx --start=2025-01-01 --report_type=account
-----
-----
Cluster/Account/User Utilization 2025-01-01T00:00:00 - 2025-08-21T14:59:59
(20095200 secs)

Usage reported in TRES Hours
-----
-----
Cluster    Login    Proper Name    Account    TRES Name    Used
-----
baobab          PI1    billing    56134
yggdrasil       PI1    billing    105817
bamboo          PI2    billing    5416
baobab          PI2    billing    1517001
yggdrasil       PI2    billing    23775
bamboo          PI3    billing    0
baobab          PI3    billing    1687963
yggdrasil       PI3    billing    1344599
[...]
Total usage: 7.36M
```

sreport examples

Here are some examples that can give you a starting point :

To get the number of jobs you ran (you ↔ \$USER) in 2018 (dates in yyyy-mm-dd format) :

```
[brero@login2 ~]$ sreport job sizesbyaccount user=$USER PrintJobCount
start=2018-01-01 end=2019-01-01
-----
-----
Job Sizes 2018-01-01T00:00:00 - 2018-12-31T23:59:59 (31536000 secs)
Units are in number of jobs ran
-----
Cluster    Account    0-49 CPUs    50-249 CPUs    250-499 CPUs    500-999 CPUs
```

```
>= 1000 CPUs % of cluster
```

baobab	root	180	40	4	15
0		100.00%			

You can see how many jobs were run (grouped by allocated CPU). You can also see we specified an extra day for the *end date* `end=2019-01-01` in order to cover the whole year :

```
Job Sizes 2018-01-01T00:00:00 - 2018-12-31T23:59:59 ''
```

You can also check how much CPU time (seconds) you have used on the cluster between since 2019-09-01 :

```
[brero@login2 ~]$ sreport cluster AccountUtilizationByUser user=$USER
start=2019-09-01 -t Seconds
```

Cluster/Account/User Utilization 2019-09-01T00:00:00 - 2019-09-09T23:59:59
(64800 secs)

Usage reported in CPU Seconds

Cluster	Account	Login	Proper Name	Used	Energy
baobab	rossigno	brero	BRERO Massimo	1159	0

In this example, we added the time `-t Seconds` parameter to have the output in seconds. *Minutes* or *Hours* are also possible.

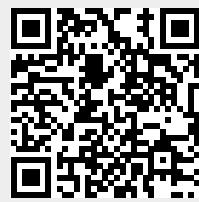

Please note :

- By default, the CPU time is in Minutes
- It takes up to an hour for Slurm to update this information in its database, so be patient
- If you don't specify a start, nor an end date, yesterday's date will be used.
- The CPU time is the time that was allocated to you. It doesn't matter if the CPU was actually used or not. So let's say you ask for 15min allocation, then do nothing for 3 minutes then run 1 CPU at 100% for 4 minutes and exit the allocation, then 7 minutes will be added to your CPU time.

Tip : If you absolutely need a report including your job that ran on the same day, you can override the default end date by forcing tomorrow's date :

```
sreport cluster AccountUtilizationByUser user=$USER start=2019-09-01
end=$(date --date="tomorrow" +%Y-%m-%d) -t seconds
```
